

Micro Tunings For Special Keyboard Techniques

About Micro Tuning...

Micro tuning has been one of the most highly touted new features of the DX7 II. Much has been written about exotic scales, and historic tuning systems. However, rather than provide you with a collection of non-standard tunings, I've decided to show you a way to use the micro tuning parameters to enhance your playing within normal (i.e. 12 tone equal temperament) tuning systems.

| | Coarse Tune | Fine Tune | Tuning Units |
|-----|----------------|--------------|-----------------|
| C3 | C1 | 0 | 2986 |
| C*3 | C*1 | 0 | 3072 |

Figure 10: Here are two unison tunings set up as micro tune scales. For the examples in this book, only the keys that have been retuned will be shown. The keys not shown in the charts are tuned to their standard pitches.

You'll find that you can retune the keyboard to many musically useful tunings without ever leaving the realm of equal temperament. There are two basic techniques I want to share with you—unison, and diatonic harmony tunings. Unison tunings will let you play the techniques from the previous section without having to use the split mode. This will let you take advantage of the DX7 II's dual mode for layered sounds and stereo effects. Diatonic harmony tunings make it possible for you to play perfectly harmonized double leads in whatever key you want (and more). The tunings will be shown in charts like *Figure 10*:

| Coarse Tune | Fine Tune | Tuning Units |
|----------------|--------------|-----------------|
| C0 | C2 0 | 4010 |
| C#0 | C#2 0 | 4096 |
| D0 | D2 0 | 4181 |

| G2 | G2 0 | 4608 |
| G#2 | G#2 0 | 4693 |
| A2 | A2 0 | 4778 |
| A#2 | A#2 0 | 4864 |
| B2 | B2 0 | 4949 |
| C3 | C3 0 | 5034 |

Figure 11: This is how to set up a split at pitch C3 for voices that have been transposed to C2.

The keys along the left edge of the chart correspond to the keys on your DX7 II. They are numbered with the same system—key C3 on the chart equals the key labelled “C3” on your keyboard. To the right of each key in the chart is a box showing the coarse and fine tuning parameter values, as well as the tuning unit value for the key. These correspond to the parameters shown in the DX7 II's “MESSAGES/DATA” display. To setup the various examples, you will only need to adjust the “coarse” tuning parameters for the keys in the chart. Since all of the tunings I'll be showing you are variations of the standard equal tempered scale, you won't have to make any changes to the “fine” parameters.

Transpose and Micro Tune Editing

Normally, DX7 II voices are tuned so that key numbers and pitch numbers are the same. In other words, the key C3 will play the *pitch* C3. This relationship can be changed with the voice's *transpose* parameter (**Button 7**). To shift a voice down one octave, the parameter is set to “C2.” Now, key C3 plays pitch C2. Shifting the voice up an octave would require setting the transpose value to “C4.” Key C3 would play pitch C4. You could also shift by some other interval besides an octave. To shift the voice up a tenth the transpose value is set to E4. Now, key C3 plays pitch E4.

Remember that when you are setting up micro tune scales, the display values are for pitches not keys. If you use the tunings given below with a transposed voice, the split point will not be at key C3, but at the key that plays the pitch C3. If you want to keep the split at the same key as other non-transposed voices, you'll have to alter the tuning accordingly.

For example, I love to use the factory presets 22 Clavistuff and 31 Wirestrung together with unison tuning. Both of these voices are transposed to C2. This shifts the split point to key C4. To keep the split at key C3, I shift the entire micro tune scale down an octave (*Figure 11*).

Unison Tuning with Micro Tuning

Earlier, I showed you how to setup unison tunings from the split mode using the split point and note shift parameters. You can also setup unison tunings as a micro tune scale. Although the performance techniques used for either method are exactly the same, there is a big difference in the types of sounds you can play. Here's why.

If you use the split mode to setup a unison tuning, you must assign the same FM voice to each side of the split. This limits you to single voice sounds for unison tuning parts. Many of the DX7 II's layered (dual mode) sounds will work particularly well when you play them with unison tuning techniques, but you'd need two DX7 IIs to create the layering effect in the split mode. Split mode unison tunings also put some limitations on panning effects as well. If the **Pan Button** is lit, the left hand part will appear on the left side of your stereo mix, and the right hand part will appear on the right side. This can be a useful panning configuration for certain sounds, but it will also work against others. (For example, the illusion of an acoustic guitar will be weakened if down strokes are heard on one side and up strokes on the other.)

MICRO TUNINGS FOR SPECIAL KEYBOARD TECHNIQUES

Performances for Unison Tuning with Micro Tune Scale Examples

Go back and try the examples from *Unison Tuning with the Split Mode* again with these performances:

- 1: Acoustic Gtr C3 Split, 2: Acoustic Duo Split, 3: 12 String C3 Split, 7: Verb Fanfare Split, 9: String/Verb Split, 10: Fiddle Split, 17: Roundwound Chorus, 19: Another Strummer, 22: Cajun Squeeze Box, and 25: Jazz Tremolo Split

When you setup a unison tuning as a micro tune scale, you only need one voice to perform the part since the scale defines the split. This gives you the freedom to put the DX7 II in the dual mode and assign a second complimentary voice to the same micro tune scale. Now you can use layered sounds to play unison tuned parts. For panning effects, each voice will be split in the stereo mix, not in each hand. You can also use the *dual detune* parameter to create a stereo chorus effect (**Button 28**).

Setting Up Unison Tuned Scales

Here are the unison tunings we looked at before, but this time they are setup as micro tune scales. They split the keyboard at C3, and F2 (*Figure 12*). Be sure to go back to the musical examples and exercises in *Unison Tuning with the Split Mode* and try them out with this new approach!

| B3 | D4 | 0 | 6229 |
| C4 | E4 | 0 | 6400 |

Figure 13: Diatonic harmony tuning for one octave in the key of C major.

About Diatonic Harmonies ...

Most synths provide a transpose function of some type that will allow you to tune two voices (or oscillators) to a fixed interval so you can play two notes from one key. It's a nice effect. You can play rapid melodic phrases since your playing single notes, but the tuning fattens up the sound by providing a harmony to each key. A serious limitation of this technique is, of course, that the harmony is exactly the same for each note played. You can only play so much tuned in perfect fifths or major thirds (etc.) before your notes clash with the chord changes, or the melody gets boring since your choice of supporting chords is limited by the fixed interval.

Consider the problem of playing melodies harmonized in thirds in a major key (Ionian mode). To harmonize a third above the first, fourth, and fifth degrees of the scale you must play major thirds. To harmonize above the second, third, sixth, and seventh degrees, you must play minor thirds. With a fixed transposition you could harmonize with one set of notes or the other, but not both. Wouldn't it be great if you could tell the DX7 II what key or mode you're playing in and have it play the correct harmony for whatever scale degree you play? Guess what? You can program your DX7 II to do just that!

Diatonic Harmonies with Micro Tune Scales

When the DX7 II is in the dual mode, you can turn the micro tuning parameter off for either voice A or voice B (**Button 29**). When micro tuning is set to "off," the voice will play the normal 12 tone equal tempered scale. If you turn micro tuning off for one voice (let's say voice A) and on for the other (voice B), you can easily create a micro tune scale that harmonizes each key with a diatonic pitch. (Diatonic means notes that are in the same key signature.) When you play a single key, you will hear two notes. Voice A will play the normal keyboard pitch. Voice B will play the harmony pitch. Since the harmonization will always be correct you can improvise freely. It's both a wonderful and useful musical effect. It works well with everything from blues-based double leads, to "classical" string parts, to big band woodwind soli. Also, since this technique utilizes the DX7 II's dual mode, your harmonized voices can have a completely different sounds. For example this let's you play, brass lines doubled with vibes harmonized in the same key a sixth below. (Try doing that with a standard keyboard!) You could even split the brass and vibes left and right in the stereo mix.

Here's an example of how you would harmonize one octave in the key of C in diatonic thirds (*Figure 13*).

Example 38

Diatonic Harmony (3rds) Key of C

You Play This ...

You Hear This

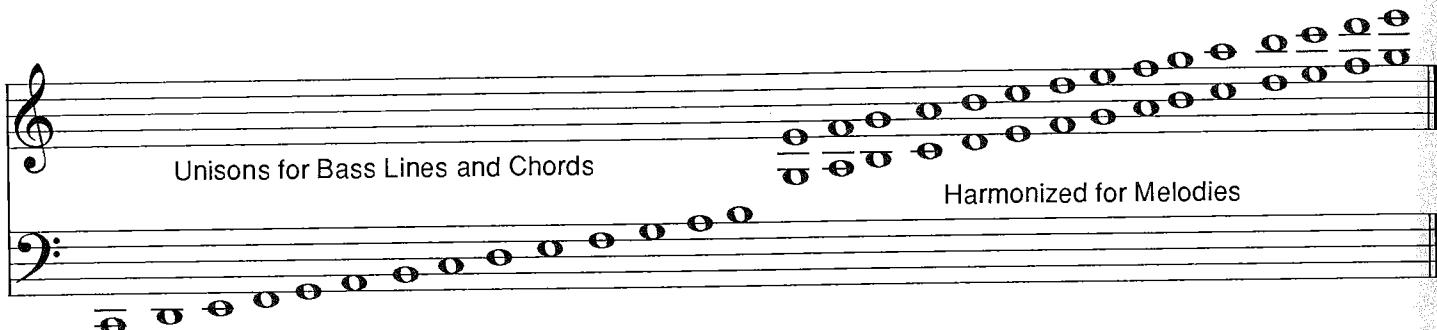

Voice A plays the written note. Voice B plays a third above in key of C

MICRO TUNINGS FOR SPECIAL KEYBOARD TECHNIQUES

For each note you play you hear two (*Example 38*). The note corresponding to the key you've pushed, and another one a third above it. Depending on the note you play, you hear a major or minor third. Diatonic notes (the white keys in the key of C) are harmonized with other diatonic notes. Accidentals (the black keys in the key of C) can either be treated as altered tensions or passing tones. To treat them as altered tensions, harmonize them with diatonic notes. To treat them as passing tones, harmonize them with other accidentals.

You can transpose this one octave micro tuning over the entire keyboard so that every key you play sounds a diatonic harmony. However, I've found that I have more flexibility if I split the keyboard so that the lower half plays both voices in unison or octaves, and the upper half plays the harmony notes (*Figure 14*). I also like the key I'm playing to sound the upper note of the harmony, so I tune my diatonic harmony scales a sixth below rather than a third above. This tuning system gives me the freedom to play chords or bass lines with my left hand and harmonized melodies in my right (*Example 39*).

Example 39

| C6 | E5 | 0 | 7424 |

Figure 14.

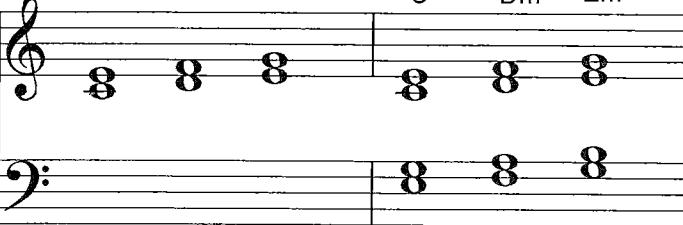

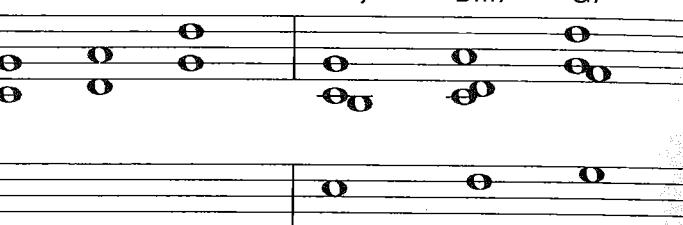

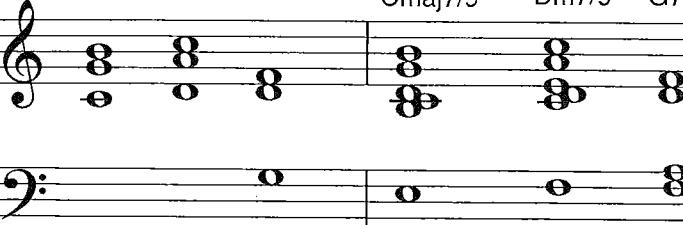

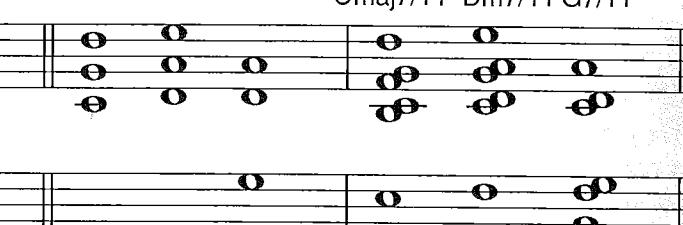

Playing Diatonic Harmonies

You are not limited to playing single notes with diatonic tunings. Be sure to experiment with two and three note chords as well as melodies. You can create many rich and unusual voicings with just two or three notes. Here are some guidelines to creating harmonies with the scales I've included at the end of this section.

- The scales I've given you are harmonized in sixths. When you play a scale tone, you will hear a second pitch a diatonic sixth below it.
- If you play diatonic thirds (C and E, etc.) you will hear a diatonic triad with the upper note doubled an octave below.
- If you play diatonic fifths or fourths (C and G, etc.) you will hear a diatonic 7th chords.
- Voicings containing scale tones 2, 4, or 7 will add upper tensions to a chord (11, 13, and 9 respectively).

Here's are some examples of the different types of voicings you can create (*Example 40*).

Example 40

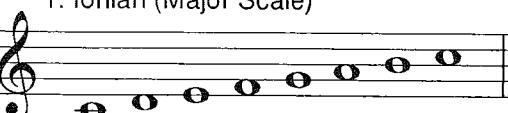

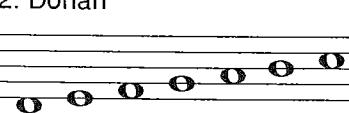

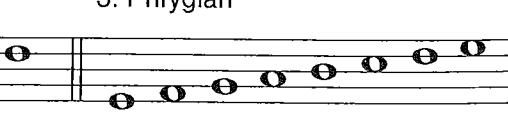

| | |
|---|---|
| You Play  | You Hear C Dm Em  |
| You Play  | You Hear Cmaj7/9 Dm7/9 G7/9  |

The scales I've given you are by no means a complete or definitive collection of all of the possibilities. They're meant to be a jumping off point for you. Be sure to try different harmony intervals. There's no reason to keep them in 6ths. You could harmonize in thirds, or fourths, or tenths. You could change the harmony interval with each scale tone. Try different tunings of the accidentals too.

About Keys and Modes...

It won't take you long to realize just how powerful the ability to harmonize diatonically is. You'll also soon realize that there are many possible scales to tune to besides the C major scale. A major scale is a specific pattern of half steps and whole steps. If you start the pattern from any given pitch, you will create a major scale. It is possible to create seven related patterns from a major scale (*Example 41*). They are called natural modes. The patterns are created by making a new diatonic scale starting on each note in the major scale.

Example 41

| | | |
|---|--|---|
| 1. Ionian (Major Scale)  | 2. Dorian  | 3. Phrygian  |
|---|--|---|

MICRO TUNINGS FOR SPECIAL
KEYBOARD TECHNIQUES

4. Lydian 5. Mixolydian 6. Aeolian

7. Locrian

1. Ionian 2. Dorian 3. Phrygian

4. Lydian 5. Mixolydian 6. Aeolian

7. Locrian

Modes are sometimes called "chord scales" since each mode harmonizes with a specific chord—major 7, minor seven, dominant 7, etc. Knowing the mode that goes with a particular chord can be a great help when you improvise. For example, suppose you'll be playing over an F7 chord. If you're familiar with modes, you'll know that you can play any series of notes from the F Mixolydian mode (same notes as in a B flat major scale) over the chord and they'll sound fine. If the chord was an F maj7#11 you could play any series of notes from the F Lydian mode (same notes as a C major scale). Here are the characteristic chords for each of the modes (*Example 42*).

Example 42

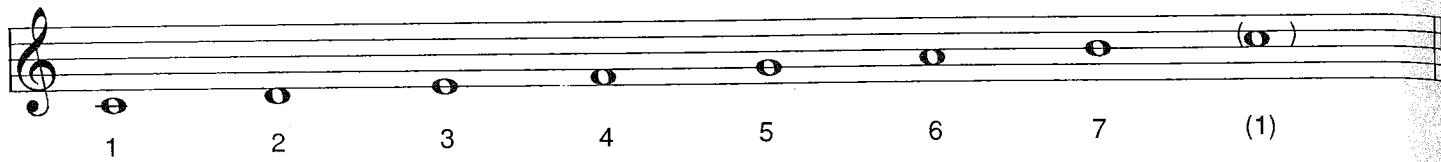

Musical staff diagrams showing micro tunings for seven modes:

- 1. Ionian: Maj7
- 2. Dorian: Min7
- 3. Phrygian: Min7 b9 b13
- 4. Lydian: Maj7 #11
- 5. Mixolydian: Dom7
- 6. Aeolian: Min7 b13
- 7. Locrian: Min7 b5 b9 b13

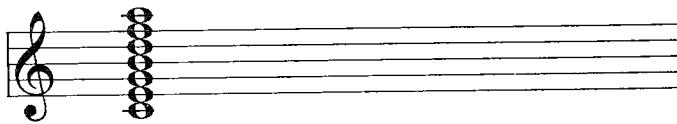

Micro Tune Scales for the Natural Modes

On the following pages are the micro tunings for each of the seven natural modes. They are all built on C. The scale is in unison below C3 and harmonized a sixth below keys from C3 to C6. I've provided them so you can experiment improvising harmonized melodies over different modes and chords. With each tuning, I've listed the related modes and the chords that will harmonize with right hand melodies. I've also shown the diatonic notes for each mode as a guideline for you to construct chords or bass lines with your left hand.

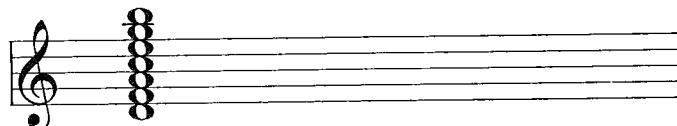

C Ionian Micro Tune Scale

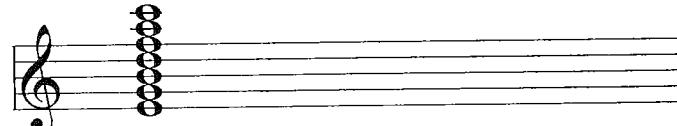

Cmaj7: C Ionian

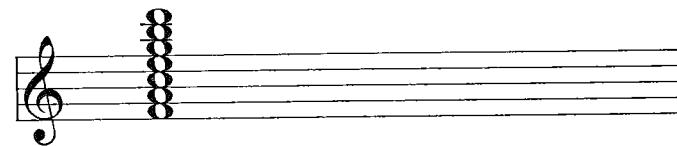

Dm7: D Dorian

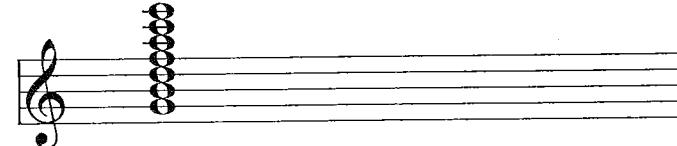

Em7b9/13: E Phrygian

Fmaj7#11: F Lydian

G7: G Mixolydian

Am7b13: A Aeolian

Micro Tune Scales for the Synthetic Modes

There are several modes based on patterns not found in the major scale. The different types of scales formed by these patterns are called *synthetic modes*. I've provided you with tuning data for each of these synthetic modes along with the characteristic chords for the first step in the mode (*Example 43*). Unlike the natural modes, there are no formal names for the new modes that could be built on the successive steps of each synthetic mode.

Example 43

| | |
|--|---|

MICRO TUNINGS FOR SPECIAL
KEYBOARD TECHNIQUES

The image displays four musical staves, each with a key signature and note heads indicating specific pitch ratios or tunings. The first staff, labeled 'Hungarian Major', has a key signature of one sharp and one flat, with notes 1 through 7 and an octave (1) indicated below the staff. The second staff, labeled 'Symmetrical', has a key signature of one sharp and one flat, with notes 1 through 7 and an octave (1) indicated below the staff. The third staff, labeled 'Pentatonic Major', has a key signature of one sharp, with notes 1, 2, 3, 5, and 6, plus an octave (1) indicated below the staff. The fourth staff, labeled 'Pentatonic Minor', has a key signature of one flat, with notes 1, b3, 4, 5, and b7, plus an octave (1) indicated below the staff.

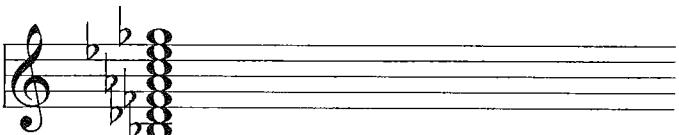

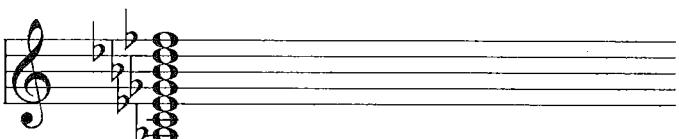

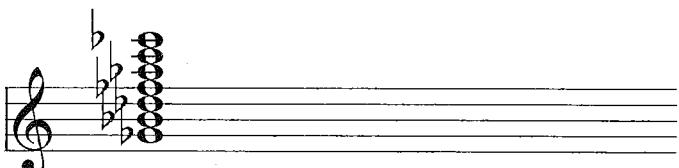

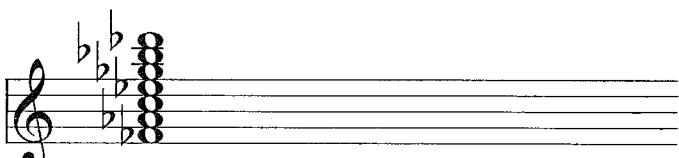

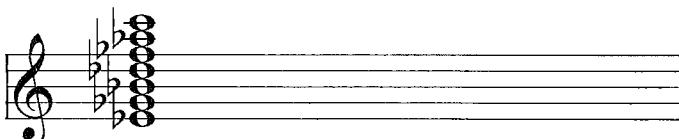

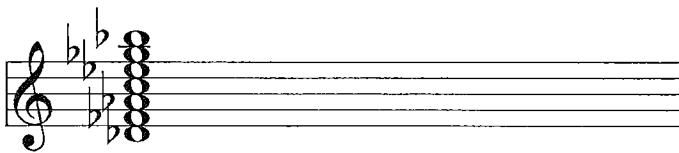

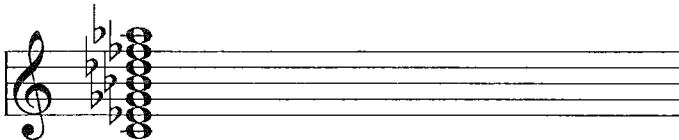

Micro tunings for the sixteen synthetic modes begin on the following page. Unlike the natural modes, there are no formal chord names for the chords built on these synthetic modes, since they do not follow any natural scale pattern. Therefore, you will not see any chord names shown above them as you did on the natural modes.

C Double Harmonic Micro Tune Scale

Double Harmonic

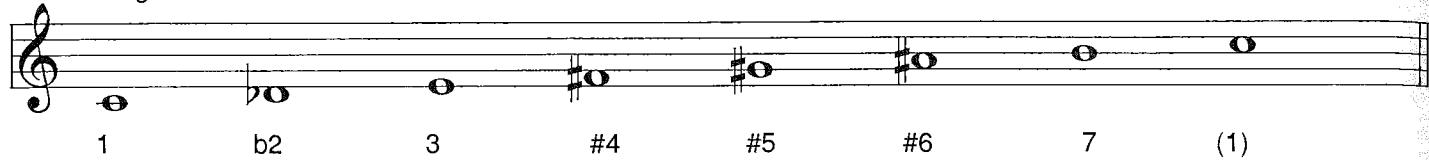

Seven vertical musical staves, each with a treble clef and a key signature of one flat. The notes on each staff correspond to the notes in the scale above them. The staves are arranged vertically from top to bottom, showing different tuning configurations.

C Pentatonic Major Micro Tune Scale

Pentatonic Major

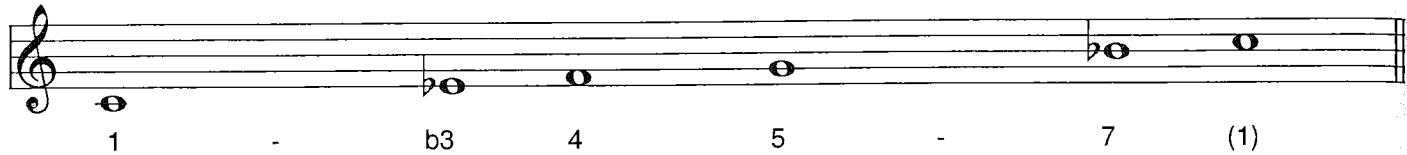

Five blank musical staves in treble clef, each consisting of five horizontal lines and four spaces. These staves are intended for the user to write in the specific micro-tuning values for each note of the scale.
